

# exotics SPH

*Saccharomyces cerevisiae* / *S. paradoxus* hybrid

## A novel yeast for exotic, complex, barrel fermented white wines

### Origin

Anchor Exotics SPH is a product of the yeast hybridisation program of The Institute for Wine Biotechnology, Stellenbosch University, South Africa.

### Application

Anchor Exotics SPH is a hybrid between *S. cerevisiae* and *S. paradoxus*. *S. paradoxus* is the closest relative to *S. cerevisiae* and is found on grapes. This hybrid inherited the aromatic capabilities of both its parents, thereby expanding the aromatic potential and complexity of what pure *S. cerevisiae*s have to offer. Wines produced by this yeast are described as having exotic aromas and flavours. Anchor Exotics SPH is recommended for the production of barrel fermented Chenin blanc, Chardonnay and Viognier. It enhances guava, passion fruit, tropical fruit salad and stone fruit aromas and flavours. It is cold sensitive and ferments at a steady rate in barrels, producing good mouth feel.

### Fermentation kinetics

- ◆ Conversion factor<sup>1</sup>: 0.58 - 0.62

### Technical characteristics

- ◆ Cold tolerance: 16°C (61°F)
- ◆ Optimum temperature range: 16 - 20°C (61 - 68°F)
- ◆ Osmotolerance<sup>2</sup>: 25°Balling/Brix, 13.9 Baumé
- ◆ Alcohol tolerance<sup>3</sup> at 20°C (86°F): 15.5%

### Metabolic characteristics

- ◆ Glycerol production: 9 - 10 g/l
- ◆ Volatile acidity production: generally lower than 0.4 g/l
- ◆ SO<sub>2</sub> production: none to very low
- ◆ Nitrogen requirement: average
- ◆ Pectinolytic activity: yes

### Phenotype

- ◆ Killer positive

### Dosage

- ◆ 30 g/hl (2.5 lb/1000 gal)

### Packaging

Anchor Exotics SPH is vacuum-packed in 250g packets. It must be stored in a cool (5 - 15°C, 41 - 59°F), dry place, sealed in its original packaging.

1. Conversion factor of sugar (°Balling / °Brix) to alcohol (% v/v) is dependent on the initial sugar concentration of the grape must, the residual sugar in the final wine, the temperature of fermentation and the type of fermentation vessel.
2. Osmotolerance is the highest sugar concentration a yeast can ferment to dryness, if used in accordance with Anchor Yeast's recommendations in healthy grape must.
3. Alcohol tolerance is dependent on the temperature of fermentation. The higher the fermentation temperature, the greater the toxic effect of alcohol on yeast cell membranes and thus a lower alcohol tolerance.

## REHYDRATION PROCEDURE

**STEP 1:** Add 1 kg of yeast to 10 L of diluted must, +/- 7° Brix (4 Baumé) at 35 - 38°C (95 - 101°F) while mixing gently to prevent the yeast from clumping. Avoid using chlorinated water.

**STEP 2:** Allow to stand for 10 - 20 minutes.

**STEP 3:** Stir to disperse the yeast and cool to within 10°C (15 - 20°F) of the must temperature, using the must.

**STEP 4:** Add the mix to the fermentation.

Our liability is specifically limited to supplying products that conform to our specifications and that will perform when used as per the instructions on this data sheet. Every application must be adapted to the conditions prevailing and the user accepts full responsibility for this.
